

We need the ocean to produce oxygen.  
Wherever we are, two out of every three breaths  
contain oxygen produced by the ocean.

To grow the food that we  
eat we need a steady climate  
and plenty of rainfall. Both  
of these things are  
dependent on the ocean.

Many of the materials in the clothes that we wear  
are grown on farms (like cotton or wool).  
Without rainfall and a steady climate we wouldn't be  
able to produce these products.
